b) Reflexivity:

Let (a, b) be an arbitrary element belonging to $N \times N$
So, $(a, b) \in N \times N$.

$$\text{As, } a - a = b - b = 0,$$

$(a, b) R (a, b)$ for all $(a, b) \in N \times N$

$\therefore R$ is reflexive

• Symmetric:

Let $(a, b), (c, d) \in N \times N$ such that $(a, b) R (c, d)$.
So,

$$a - c = b - d \quad [\text{Given Relation}]$$

Multiplying by (-1) on both sides,

$$c - a = d - b$$

Hence, $(c, d) R (a, b)$

For $(a, b) R (c, d)$ there is $(c, d) R (a, b)$ for $(a, b), (c, d) \in N \times N$

$\therefore R$ is symmetric

Transitivity:

Let $(a, b), (c, d), (e, f) \in N \times N$ such that $(a, b) R (c, d)$ and $(c, d) R (e, f)$

From the two relations,

$$a - c = b - d \quad \text{--- ①}$$

$$c - e = d - f \quad \text{--- ②}$$

$$\text{①} + \text{②}$$

$$a - c + c - e = b - d + d - f$$

So, $a - e = b - f$

Hence, $(a, b) R (e, f)$

For $(a, b) R (c, d)$ and $(c, d) R (e, f) \Rightarrow (a, b) R (e, f)$ for $(a, b), (c, d), (e, f) \in N \times N$

Hence, R is transitive

As R is reflexive, symmetric and transitive, hence R is an equivalence relation.

As the required line bisects line segment AB, midpoint of line segment AB lies on required line.

Let midpoint of line segment AB be P.

$$P = \left(\frac{2+4}{2}, \frac{3+5}{2}, \frac{4+8}{2} \right) = (3, 4, 6)$$

As required line is perpendicular to two lines,

$$L_1: \frac{x-8}{3} = \frac{y+19}{-16} = \frac{z-10}{7} \quad \text{and} \quad L_2: \frac{x-15}{3} = \frac{y-29}{8} = \frac{z-5}{-5}$$

the direction vector of required line is found by taking cross product of direction vectors of L_1 and L_2 . Let direction vector of required line be \vec{a} .

$$\vec{a} = (3\hat{i} - 16\hat{j} + 7\hat{k}) \times (3\hat{i} + 8\hat{j} - 5\hat{k})$$

$$= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & -16 & 7 \\ 3 & 8 & -5 \end{vmatrix}$$

$$= \hat{i} (80 - 56) - \hat{j} (-15 - 21) + \hat{k} (24 + 48)$$

$$= 24\hat{i} + 36\hat{j} + 72\hat{k}$$

DR's of required line = $\langle 24, 36, 72 \rangle = \langle 2, 3, 6 \rangle$
 Simplified Direction vector = $2\hat{i} + 3\hat{j} + 6\hat{k}$

So, Required line is

$$\vec{r} = \vec{OP} + \lambda (2\hat{i} + 3\hat{j} + 6\hat{k})$$

$$\vec{r} = 3\hat{i} + 4\hat{j} + 6\hat{k} + \lambda (2\hat{i} + 3\hat{j} + 6\hat{k}) \quad [\text{Vector equation}]$$

Cartesian equation:

$$\frac{x-3}{2} = \frac{y-4}{3} = \frac{z-6}{6}$$

34)(a) Let $\frac{1}{x} = a, \frac{1}{y} = b, \frac{1}{z} = c.$

The equations are,

$$2a + 3b + 10c = 4$$

$$4a - 6b + 5c = 1$$

$$6a + 9b - 20c = 2$$

The matrix equation is,

$$\begin{bmatrix} 2 & 3 & 10 \\ 4 & -6 & 5 \\ 6 & 9 & -20 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} 4 \\ 1 \\ 2 \end{bmatrix}$$

${}_{3 \times 3} A \quad {}_{3 \times 1} X \quad {}_{3 \times 1} B$

Its of the form $AX = B$

$$\begin{aligned} |A| &= 2(120 - 45) - 3(-80 - 30) + 10(36 + 36) \\ &= 2(75) - 3(-110) + 10(72) \\ &= 150 + 330 + 720 \\ &= 1200 \end{aligned}$$

As $|A| \neq 0$, above equation have an unique solution

So, $AX = B$

Pre-multiplying by A^{-1} ,

$$A^{-1}AX = A^{-1}B$$

$$IX = A^{-1}B$$

$$X = A^{-1}B$$

$$A = \begin{bmatrix} 2 & 3 & 10 \\ 4 & -6 & 5 \\ 6 & 9 & -20 \end{bmatrix}$$

$$\cdot \operatorname{adj} A = \begin{bmatrix} 75 & 110 & 72 \\ -(-60-90) & -40-60 & -(18-18) \\ 15+60 & -(10-40) & -12-12 \end{bmatrix}^T$$

$$= \begin{bmatrix} 75 & 110 & 72 \\ 150 & -100 & 0 \\ 75 & 30 & -24 \end{bmatrix}^T$$

$$= \begin{bmatrix} 75 & 150 & 75 \\ 110 & -100 & 30 \\ 72 & 0 & -24 \end{bmatrix}$$

$$\cdot A^{-1} = \frac{1}{|A|} \operatorname{adj} A$$

$$X = A^{-1}B$$

$$X = \frac{1}{1200} \begin{bmatrix} 75 & 150 & 75 \\ 110 & -100 & 30 \\ 72 & 0 & -24 \end{bmatrix} \begin{bmatrix} 4 \\ 1 \\ 2 \end{bmatrix}$$

$$X = \frac{1}{1200} \begin{bmatrix} 300 + 150 + 150 \\ 440 - 100 + 60 \\ 288 + 0 - 48 \end{bmatrix}$$

$$X = \frac{1}{1200} \begin{bmatrix} 600 \\ 400 \\ 240 \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{3} \\ \frac{1}{5} \end{bmatrix}$$

So, $\begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{3} \\ \frac{1}{5} \end{bmatrix}$

Hence, $a = \frac{1}{2}$, $b = \frac{1}{3}$, $c = \frac{1}{5}$

$$F = \frac{V^2}{500} - \frac{V}{4} + 14$$

1) When $V = 40 \text{ km/hr}$,

$$F = \frac{(40)^2}{500} - \frac{40}{4} + 14$$

$$= \frac{1600}{500} - 10 + 14$$

$$= 3.2 + 4$$

$$= 7.2 \text{ (2/100 km)}$$

Ans: $F = 7.2 \text{ (2/100 km)}$

(ii)

$$F = \frac{V^2}{500} - \frac{V}{4} + 14$$

$$\frac{dF}{dV} = \frac{2V}{500} - \frac{1}{4} + 0$$

Ans. $\frac{dF}{dV} = \frac{V}{250} - \frac{1}{4}$

iii)

(a) $\frac{d^2F}{dV^2} = \frac{1}{250}$

Now, put $\frac{dF}{dV} = 0$

$$\frac{V}{250} - \frac{1}{4} = 0 \Rightarrow \frac{V}{250} = \frac{1}{4}$$

So, $V = 62.5$ (km/h)

As $\frac{d^2F}{dV^2}$ is positive for $V = 62.5 \text{ km/hr}$,

F attains minimum at that point.

Ans: $V = 62.5 \text{ km/hr}$

26)(a) $x = e^{\cos 3t}$

Taking log on both sides,

$\log_e x = \cos 3t$ - ①

Differentiating w.r.t t,

$\frac{1}{x} \frac{dx}{dt} = -3 \sin 3t$

So, $\frac{dx}{dt} = x(-3 \sin 3t)$ - ②

$Y = e^{\sin 3t}$

Taking log on both sides,

$\log_e y = \sin 3t$ - ③

Differentiating w.r.t t,

$\frac{1}{y} \frac{dy}{dt} = 3 \cos 3t$

$$\frac{dy}{dt} = y (3 \cos 3t) \quad \text{--- (4)}$$

$$\text{(4)} \div \text{(2)}$$

$$\frac{dy}{dx} = \frac{y (3 \cos 3t)}{x (-3 \sin 3t)} = -\frac{y}{x} \frac{(\cos 3t)}{(\sin 3t)}$$

As $\log x = \cos 3t$ and $\log y = \sin 3t$ from (1) and (2),

$$\frac{dy}{dx} = -\frac{y}{x} \frac{(\log x)}{(\log y)} = -\frac{y \log x}{x \log y}$$

\therefore Hence proved that

$$\frac{dy}{dx} = -\frac{y \log x}{x \log y}$$

27)

$$I = \int_{-2}^2 \sqrt{\frac{2-x}{2+x}} dx$$

Take $x = 2 \cos \theta$
 $dx = -2 \sin \theta d\theta$

The limits change

x	2	-2
θ	0	π

$\left[\begin{array}{l} 2 = 2 \cos \theta \rightarrow \theta = 0 \\ -2 = 2 \cos \theta \rightarrow \theta = \pi \end{array} \right]$

So,

$$I = \int_{\pi}^0 \sqrt{\frac{2-2\cos\theta}{2+2\cos\theta}} (-2\sin\theta d\theta)$$

$$I = \int_0^{\pi} \sqrt{\frac{1-\cos\theta}{1+\cos\theta}} (-2\sin\theta d\theta)$$

$$I = \int_0^{\pi} \frac{2 \sin^2 \theta/2}{2 \cos^2 \theta/2} (-2 \sin \theta d\theta)$$

$$I = \int_{\pi/2}^0 \tan \theta/2 (-2 \sin \theta d\theta)$$

Using property $\int_a^b f(x) dx = - \int_b^a f(x) dx$

$$I = \int_0^{\pi} (\tan \theta/2) (2 \sin \theta d\theta) \quad [\sin \theta = 2 \sin \theta/2 \cos \theta/2]$$

$$I = \int_0^{\pi} \frac{\sin \theta/2}{\cos \theta/2} (4 \sin \theta/2 \cos \theta/2 d\theta)$$

$$I = 4 \int_0^{\pi} \sin^2 \theta/2 d\theta$$

$$I = 4 \int_0^{\pi} \left(\frac{1 - \cos \theta}{2} \right) d\theta$$

$$I = 2 \int_0^{\pi} (1 - \cos \theta) d\theta$$

$$= 2 (\theta - \sin \theta) \Big|_0^{\pi}$$

$$= 2 ((\pi - \sin \pi) - (0 - \sin 0))$$

$$28) (a) \quad 2xy + y^2 - 2x^2 \frac{dy}{dx} = 0.$$

$$\frac{dy}{dx} = \frac{2xy + y^2}{2x^2}$$

$$\frac{dy}{dx} = \frac{y}{x} + \frac{1}{2} \frac{y^2}{x^2} \quad \text{--- (1)}$$

Take $y = vx$.

Differentiating w.r.t. x , $\frac{dy}{dx} = v + x \frac{dv}{dx}$ --- (2)

Sub $\frac{y}{x} = v$ in ① and equate ① and ②

$$v + x \frac{dv}{dx} = v + \frac{1}{2} v^2$$

$$x \frac{dv}{dx} = \frac{v^2}{2}$$

So, on re-arranging,

$$\int \frac{dx}{x} = 2 \int \frac{dv}{v^2}$$

Integrating on both sides,

$$\ln|x| + c = 2 \int v^{-2} dv$$

$$\ln|x| + c = 2 \left[\frac{v^{-2+1}}{-2+1} \right] = \frac{-2}{v}$$

$$\ln|x| + c = \frac{-2}{v} = \frac{-2x}{y} \quad [v = \frac{y}{x}]$$

$$\text{So, } c = \frac{-2x}{y} - \ln|x|$$

$$\text{Given: } y'(x) = 2$$

$$\text{So, } c = \frac{-2(1)}{2} - \ln(1)$$

$$c = -1$$

Particular solution is,

$$I = \int x^2 \sin^{-1}(x^{3/2}) dx$$

Let $x^2 = x^3 \rightarrow \frac{2x dx}{3} = x^2 dx$

So,

~~$$I = \frac{1}{3} \int \sin^{-1}(x^2) dx$$~~

$$I = \frac{1}{3} \int 2x \sin^{-1}x dx$$

Now, $dv = 2x dx$ and $v = \sin^{-1}x$

Applying By-parts [uv - vdu],

$$3I = x^2 \sin^{-1}x - \int \frac{x^2}{\sqrt{1-x^2}} dx$$

$$= x^2 \sin^{-1}x + \int \frac{(1-x^2-1)}{\sqrt{1-x^2}} dx$$

$$= x^2 \sin^{-1}x + \int (\sqrt{1-x^2}) dx - \int \frac{1}{\sqrt{1-x^2}} dx$$

$$3I = t^2 \sin^{-1} t + \frac{t}{2} \sqrt{1-t^2} + \frac{1}{2} \sin^{-1}(t) - \sin^{-1} t + C$$

$$= \left(t^2 - \frac{1}{2}\right) \sin^{-1} t + \frac{t}{2} \sqrt{1-t^2} + C$$

Subbing $t^2 = x^3$,

$$3I = \left(x^3 - \frac{1}{2}\right) \sin^{-1}(x^{3/2}) + \frac{x^{3/2}}{2} \sqrt{1-x^3} + C$$

So,

$$I = \frac{1}{3} \left[\left(x^3 - \frac{1}{2}\right) \sin^{-1}(x^{3/2}) + \frac{x^{3/2}}{2} \sqrt{1-x^3} \right] + C \quad [C' = C/3]$$
